## Participation motivation among wheelchair athletes

Author(s) : [Brasile, F. M.](#)

Journal article : [Dissertation Abstracts International. A, Humanities and Social Sciences](#)  
Vol.49 No.9 pp.p.2806

Abstract : A survey was carried out to compare participation motivation among disabled and non-disabled athletes who participated in basketball and track, field and cross-country competitions. A Participation Reasons Scale was administered and the responses were analyzed and computed to determine the relative importance placed by athletes on the reasons for participation. A factor analysis was conducted to identify major participation factors. A rank-order correlation indicated a similarity in the relative importance of reasons for participation between the two groups.

among wheelchair and able-bodied athletes. Participation factors identified ego, task, social integration and social affective incentives. Correlational and variance techniques were used to examine the relationship between select characteristics and the five participation factors. Non-significant results were specific disability related variables and significant relationships were found between the various factor scales and disability category and the sport related. The most important implications from the study are that there appears to be similarity between the wheelchair athlete and the able-bodied athlete when motivational incentives for participation, and that motives for sport participation be a multi-dimensional phenomenon.
