A caroteneprotein complex isolated from green leaves

Author(s) : [NISHIMURA, M.](#) ; [TAKAMATSU, K.](#)

Author Affiliation : Botan. Inst., Fac. Sci., Univ. Tokyo.

Journal article : [Nature](#) 1957 Vol.180 pp.699-700

Abstract : Parsley or other leaves were homogenized in ammoniacal acetone. The homogenate was ground with quartz and centrifuged and the sediment washed with cold acetone. Cold acetone was added, and the dark green precipitate produced was washed with ammoniacal acetone to remove chlorophyll and free carotenoids. After fractionation with ammonium sulfate, dialysis and high-speed centrifuging, an orange-red solid was obtained. It was soluble in water, contained 9.5 per cent. nitrogen and gave

reactions for protein.

The pigment was separated with fat solvents, and found to have 2 per cent complex. It was indistinguishable from β -carotene. The absorption spectrum of the carotene-protein complex in water had peaks at 280, 498 and 538 $m\mu$. Evidence from sedimentation rate, birefringence and electron micrographs suggested that the complex existed as disc-shaped particles of radius about 19 $m\mu$. Each particle was estimated to contain about 3000 molecules of β -carotene. The possibility that the carotenoid compound plays a part in the physiology of green leaves is discussed.-V. H.

Indexing terms for this abstract:

Organism descriptor(s) : man, *Petroselinum crispum*

Descriptor(s) : beta-carotene, carotenoids, dialysis, fractionation, leaves, parsley,

Identifier(s) : Araliales, tetraterpenoids

Broader term(s) : Homo, Hominidae, primates, mammals, vertebrates, Chordata, eukaryotes, *Petroselinum*, Apiaceae, Apiales, eudicots, angiosperms, Spermatop
