### Abstract

The paper presents the mechanical properties of epoxy and polyester resins reinforced unidirectionally by jute and glass fibres singly and in combination as a hybrid. The results show that the jute-reinforced laminates have much better properties than the resins alone; but the properties are inferior to those of glass-reinforced plastics. The most appropriate role for the jute fibres is, perhaps, to use them as "filler" fibres in combination with glass fibres where the strength and modulus requirements are not very demanding.
