Abstract

It is supposed that the sequence of the Earth's biospheric revolutions obeys the scaling law. An estimation of the duration of the prebiological chemical evolution as $(5 \times 10^7) \sim 10^9$ years is obtained by an extrapolation of the scaling law of the biospheric evolution. The expected scale of time of interstellar prebiological panspermia $(\hat{a}^{1/4} 0.2 \sim 10^9 \text{ yr})$ is much shorter than the estimated duration of the prebiological chemical evolution. The hypothesis of the long prebiological chemical evolution implies that: (a) the prebiological evolution and the origin of life may be a self-consistent Galaxy process and not a process localized on single planets and (b) life has the same chemical base and the same chirality everywhere in the Galaxy.

Keywords

Biological evolution; Prebiological chemical evolution; Scaling law; Panspermia
