Abstract

The cherry fruit fly in Oregon was first recorded at Stayton in 1908, almost 50 years after the planting of the first cherry trees at Milwaukee. One year later, in 1909, a cherry sample from Salem was found to be infested with the same insect species. Since then, the infestation spread rapidly from its original sites, and by 1930 most of the cherry-growing areas of the State both in the Willamette Valley and northeastern Oregon were infested. Originally it was thought to be an introduced species from the eastern United States (where the pest has been a problem for a long time), and hence it was called the cherry fruit fly, *Rhagoletis cingulata* (Loew) (Lovett 1923, Newcomer 1950), although no introduction records were traced. Later workers both in Washington and Oregon (Frick et al. 1954; Jones 1937, 1938) also called this insect the cherry fruit fly, *R. cingulata*.
