Erosion and Deposition of Cohesive Soils

by Emmanuel Partheniades,

Serial Information: *Journal of the Hydraulics Division*, 1965, Vol. 91, Issue 1, Pg. 105-139

Document Type: Journal Paper

Abstract:

The effects of shear stress, suspended sediment concentration, and shear strength of bed on the erosion rate water have been investigated. The deposition rates of suspended cohesive sediment and the patterns of bed experimental range the erosion rates were found to be independent of the shear strength of the bed and the depend strongly on the bed shear stress. The minimum shear stresses for initiation of erosion were also found. There seems to exist a critical velocity for the clay part of suspended sediment, above which all such sediment velocities slightly below this critical limit, the suspended clay deposits rapidly. Scouring occurred predominant straight zone near the center of the flume.
