Abstract:

Overdentures were consecutively inserted in 92 severely resorbed maxillae and followed for 1 year. The denture a total of 430 implants. Of these, 69 (16%) became loose and were removed during the follow-up period. The m caused 7 complete failures of the overdenture treatment. Postinsertion maintenance was more extensive for th for fixed prostheses supported by implants. Problems arose in relation to the mucosa around the implants, and fatigue fractures of the acrylic resin and the retentive clips. Fewer speech problems were reported in the overde compared to those with fixed prostheses.
