Author(s): Leane, Elizabeth

Abstract:

Antarctica's unique spatiality -- its isolation, its position on the 'bottom' of the world, its seemingly limitless icy landscape, its complex and contradictory temporality. The preserving power of ice, along with the unfamiliar diurnal rhythms of the continent, gives the sense that time progresses differently in the southernmost continent. Antarctica thus offers itself as an ideal site for speculative fiction dealing with strange temporal phenomena, including 'allochronic' fiction -- novels in which different periods of history are juxtaposed - and 'cryonic' fiction, in which ice acts as a form of time machine, allowing a living being to be frozen and then thawed forward into the future. With the advent of global warming, the Antarctic ice has taken on increased temporal significance. The layers of ice provide a record of past ages and hence a means of predicting the future, and its collapsing ice shelves open the way towards catastrophes to come. Antarctica has become a literal futurescape, an idea that dystopian writers (and filmmakers) have seized upon. Focussing primarily on science fiction but also drawing on exploration narratives, this paper explores how time and space are intertwined in textual representations of Antarctica.
