ABSTRACT

The pseudorapidity density of charged particles, $dN_{ch}/d\eta$, at midrapidity in Pb-Pb

collisions has been measured at a center-of-mass energy per nucleon pair of

. The rise in $dN_{ch}/d\eta$ as a function of $\sqrt{s_{NN}}$ is steeper than that observed

vs the trend established by measurements at

lower energy. The increase of $dN_{ch}/d\eta$ as a function of the average number of participant nucleons, $\langle N_{part} \rangle$, calculated in a Glauber model, is compared with the previous measurement at $\sqrt{s_{NN}}=2.76$ TeV. A constant factor of about 1.2 describes the increase in $dN_{ch}/d\eta$ from $\sqrt{s_{NN}}=2.76$ to 5.02 TeV for all centrality classes, within the measured range of 0%–80% centrality. The results are also compared to models based on different mechanisms for particle production in nuclear collisions.

Announcement

[Information on SCOAP³ and *Physical Review* journals](#)

January 3, 2018

High Energy Physics (HEP) papers published after January 1, 2018 in *Physical Review Letters*, *Physical Review C*, and *Physical Review D* are published open access, paid for centrally by SCOAP³. Library subscriptions will be modified accordingly. This arrangement will initially last for two years, up to the end of 2019.
