Changes in Type of Contagious Disease. With Special Reference to Smallpox and Scarlet Fever. The Fourth Sedgwick Memorial Lecture.

Author(s) : [CHAPIN, C. V.](#)

Journal article : [Journal of Preventive Medicine](#) 1926 Vol.1 pp.1-29

Abstract : In this lecture the author discusses the question of the origin of smallpox in infectious disease. After a general discussion of current theories he examines in detail the recent history of smallpox and reaches the conclusion that, so far

States are concerned, mild smallpox had its origin in Florida in 1896. He can evidence that an outbreak of the classical type ever arose out of the mild form. He discusses the history of scarlet fever, illustrating his argument with statistics from various countries. He suggests that the present mild type of the disease is due to the selective force of case isolation having eliminated the more virulent strains. He points out that the fatality decreased more recently and less evenly in America than in England and that the majority of American communities were slower in adopting it and less rigorous in enforcing it than the English and Scandinavian peoples. Greenwood.
