Abstract

Whether or not we are alone in the universe is one of the great outstanding questions of existence. For thousands of years it was restricted to the realm of philosophy and theology, but 50 years ago it became part of science. In April 1960 a young US astronomer, Frank Drake, began using a radio telescope to investigate whether signals from an extraterrestrial community might be coming our way. Known as the Search for Extraterrestrial Intelligence, or SETI, it has grown into a major international enterprise, involving scientific institutions in several countries. Apart from a few oddities, however, all that the radio astronomers have encountered is an eerie silence. So is humankind the only technological civilization in the universe after all? Or might we be looking for the wrong thing in the wrong place at the wrong time?
