Abstract

We have used first principles molecular dynamics to determine the energies of Jahn-Teller distortions in a variety of neutral and negatively charged fullerene structures. We find that smaller structures have larger Jahn-Teller distortion energies. Solid C₂₈ and solid C₂₀, which have covalent bonds connecting the individual fullerene balls, are found to have energies which are much lower than the energies of their molecular components. The charged state of solid C₂₀ is found to have a total distortion energy which is about six times larger than that of C^{âˆ—}₆₀.
