Confirmation of the Distinct Genotype Groups within the Form Species *Candida parapsilosis*

Basabi Roy and Sally A. Meyer*

[+](#) Author Affiliations

ABSTRACT

The DNA relatedness and restriction fragment length polymorphism patterns of whole-cell DNA and the general phenotypic properties of 14 isolates of the form species *Candida parapsilosis* representing three diverse genetic groups were compared. The data confirm the unrelatedness of the three groups at the species level.
