#### Abstract

A stereoselective total synthesis of (+)-carpamic acid **1** has been achieved from the  $\beta$ -symmetric 3-[dimethyl(phenyl)silyl]glutaric anhydride **11** featuring its asymmetric desymmetrisation using oxazolidinone **12**. The dimethyl(phenyl)silyl group is not only acting as a masked hydroxy group but also stereodirects ester enolate methylation and facilitates the Curtius reaction of the  $\beta^2$ -silyl-amide **23**. A highly stereoselective hydrogenation of the imine **10** is the key step in the construction of the all *cis*-2,3,6-trisubstituted piperidine.
