Abstract

The epileptologically informed in-depth analysis of auto- and heteroanamnestic historical sources supports the hypothesis that Hector Berlioz (1803–1869) might have suffered from a photosensitive idiopathic generalized epilepsy syndrome with absences, absence status, myoclonic seizures, and bilateral tonic–clonic seizures. The study outlines the possible influence of the composer's probable epilepsy on his literary and musical oeuvre, including the *Symphonie fantastique en cinq parties*.
