As pet owners become more conscious of their own diets and the impact it has on their health, they naturally become more interested in what their animal companions are eating and how that might be affecting their pet's health. Many are exploring alternatives to standard commercial pet foods, and some are asking their veterinarians for advice. Small-animal nutrition is an ever-changing field. What veterinarians were taught 10 years ago may no longer be sound advice. This article explores some of the reasoning behind the development of both conventional commercial pet foods and the alternative foods and diets. It questions some of the conventional dogma as well as some of the trendy assumptions in the current marketplace. The intent is to provide the veterinarian with some balanced information on which to base nutritional advice to clients, and to begin forming new opinions or at least asking new questions. Guidelines on formulating a homemade diet for dogs are included.
