Abstract

A procedure is described for simultaneously removing red cells and dead cells from lymphoid cell suspensions, based on the observation that when populations of lymphoid cells are centrifuged on a mixture of Isopaque/Ficoll, dead cells and red cells sediment whereas viable cells float. The technique very efficiently removed red cells from a wide range of lymphoid cell suspensions and eliminated lymphocytes killed by mechanical stress, by antibody and complement and by prolonged tissue culture.

The depletion of red cells was >99% and the recovery of viable lymphocytes usually >99%, the resulting cell suspensions being around 95–100% viable. The immunological activity of B cells, helper T cells and cytotoxic T cells was virtually unimpaired by the separation procedure.
