Description

In this book, successful plant breeders and their colleagues provide a step-by-step guide to the development of a crop species, from the selection of parent cultivars to the final release of a new cultivar. The book covers the development of each step of the process, and provides a detailed description of the methods used successfully. Crop species are developed through the selection of parent cultivars that are grown together to produce a new cultivar, pure-line cultivar, or a mixture of cultivars. More of the chapters cover the development of a new cultivar through the selection of parent cultivars that are currently used in the industry.
