Abstract

This paper surveys developments in fisheries economics and fisheries policy over the past half century. Early work clarified the nature of the economic issues associated with open access, laying the groundwork for changes in policies after coastal nations expanded their jurisdictions in 1976. Perhaps the most important point made by economists is that property rights matter and that open-access conditions create economic as well as biological problems. The policy process has begun to create property rights systems, although many of the world's fisheries still operate under mixed systems of regulations and open access incentives.

â†

I thank Gardner Brown, Francis Christy, James Crutchfield, Peter Pearse, A.D.Scott, and several anonymous referees for helpful comments on an earlier draft. I also acknowledge the imperfect selectivity of my broad sweep through the intellectual history of this subfield. The choices of references included here sometimes reflect a judgment about the importance of a particular work, but more often they are simply representative examples of thinking that support my own (admittedly idiosyncratic) interpretation of the flow of events. There are many excellent contributions in the literature that are omitted, and there are many more individuals who played important roles in the policy process.
