Gender and technology: empowering women, engendering development.

Author: Everts S

Source: London, England, Zed Books, 1998. xviii, 171 p.

Abstract: This book provides a practical guide for the integration of gender into technology and development, focusing on the economic empowerment of women via technology. It demonstrates why gender awareness needs to be integrated into technology transfer, explores the technology needs of women, and looks at how technology itself can empower and disempower. The first half of the book examines women's technology needs in theory and in practice. With an overview of the gender and technology debate, the author determines how technological development can be both threat and ally to women in their various roles. A description of various programs for introducing technological innovations to women's projects is also presented, as well as an examination of the problems raised by issues of finance, training, appropriateness and sustainability. Moreover, a model-training program is also provided for successful technology transfer. Meanwhile, the second part of the book focuses on mainstreaming gender concerns into technological development through training, gender analysis and gender sensitization. It presents a number of examples and strategies of mainstreaming activities.
