Abstract

The present paper seeks to continue the analysis in Barbu et al. [Tangential boundary stabilization of Navier-Stokes equations, Memoir AMS, to appear] on tangential boundary stabilization of Navier-Stokes equations, $d=2,3$, as deduced from well-posedness and stability properties of the corresponding linearized equations. It intends to complement [V. Barbu, I. Lasiecka, R. Triggiani, Tangential boundary stabilization of Navier-Stokes equations, Memoir AMS, to appear] on two levels: (i) by casting the Riccati-based results of Barbu et al. [Tangential boundary stabilization of Navier-Stokes equations, Memoir AMS, to appear] for

Typesetting math: 100%

...ing, thus extracting the key relevant features, so that the resulting framework may be applicable also to other stabilizing boundary feedback

resulting framework may be applicable also to other stabilizing boundary feedback operators, as well as to other parabolic-like equations of fluid dynamics; (ii) by including, in the case

$d=2$ this time, also the low-level gain counterpart of the results in Barbu et al.

[Tangential boundary stabilization of Navier–Stokes equations, Memoir AMS, to appear] with both Riccati-based and spectral-based (tangential) feedback controllers. This way, new local boundary stabilization results of Navier–Stokes equations are obtained over [V. Barbu, I. Lasiecka, R. Triggiani, Tangential boundary stabilization of Navier–Stokes equations, Memoir AMS, to appear].
